

SUMMARY

During the first dekad of December 2007, the Bega's dry, sunny & windy weather condition prevailed over most parts of the country, thus the situation might have favored harvest and post harvest activities over Meher growing areas. However, rain bearing meteorological phenomenon favored light to heavy amount of rainfall over southwest portion of the country, also light rains were exhibited over parts of SNNPR, southern Oromiya and pocket areas of Tigray and Amhara the situation might have favored crops at developing stages and perennial crops, however harvest and post harvest activities might have been hampered over the aforementioned areas. On the other hand, in line with the dry, sunny and windy weather condition over Amhara, Benishangul Gumuz, much of central and eastern Oromia, Somali and eastern parts of SNNPR the observed midnight and morning cold weather condition might have caused crop damage on cereals and pulses that have not yet attained full maturity over the aforementioned frost prone areas.

During the second dekad of December 2007, most of the country remained dry and received little or no rain during the dekad. The wet condition over pocket areas of western Oromia & SNNPR might have favored crops at developing stages, perennial crops and availability of pasture and drinking water. On the other hand, the dry condition minimized the expected damage on fully matured crops and harvest and post harvest losses as result of moisture; moreover, the situation favored Meher harvest and post harvest activities in the country. However, the prevailing dry condition might have a negative impact on crops that have not attained full maturity. The observed midnight and morning cold weather condition might have caused crop damage on cereals and pulses that have not yet attained full maturity over the highlands of southern & central Amhara, central and eastern Oromia frost prone areas.

1. WEATHER ASSESSMENT

1.1 11-20 December 2007

1.1.1 RAINFALL AMOUNT (Fig.1)

All parts of the country received little or no rain during the dekad.

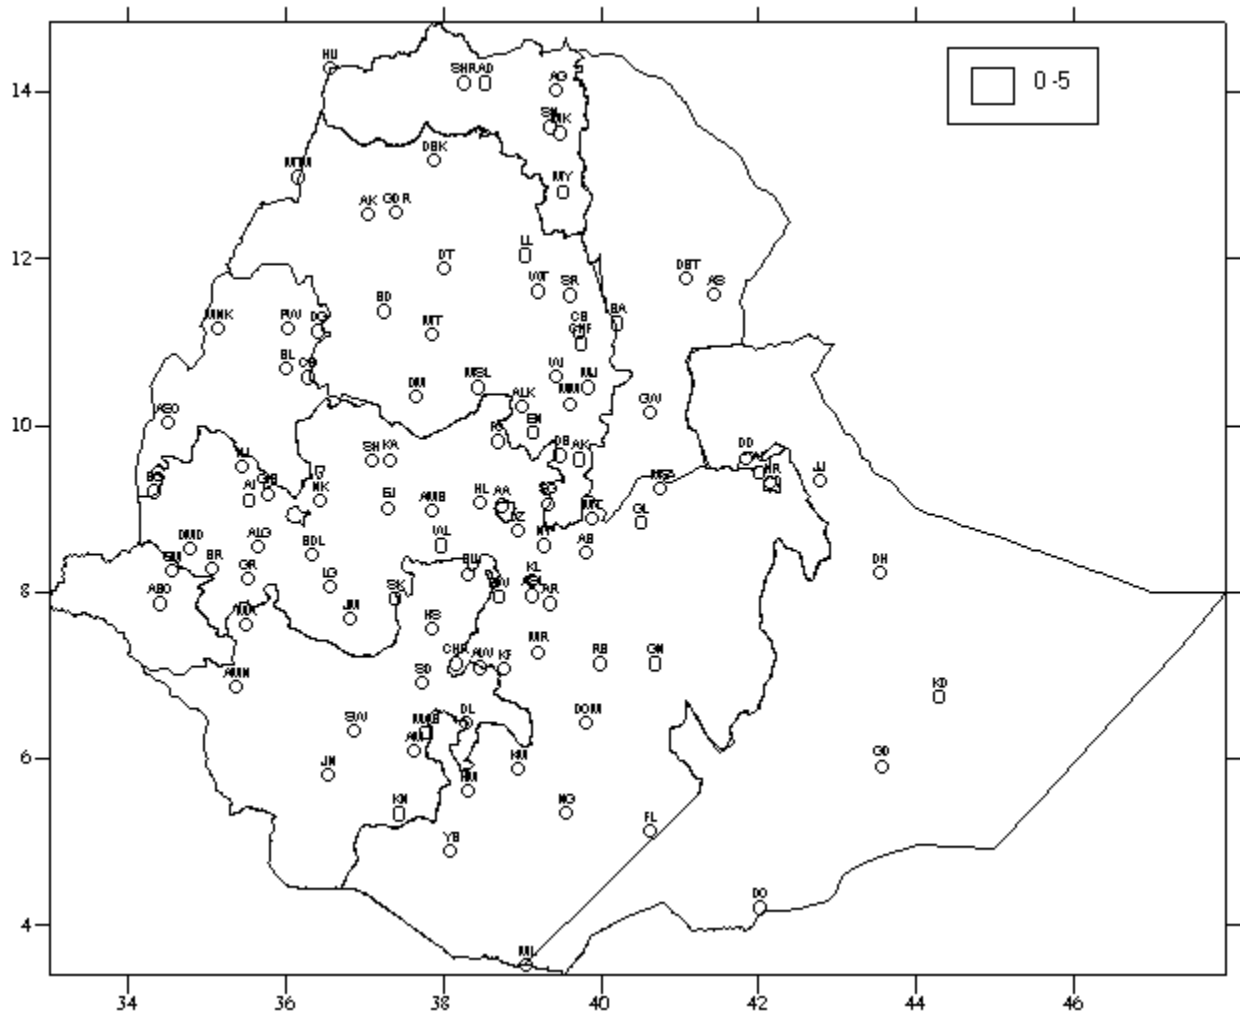

Fig 1. Rainfall distribution in mm (11-20 December 2007)

1.1.2 RAINFALL ANOMALY (Fig. 2)

All parts of the country experienced much below normal rainfall.

respectively. The situation might slightly affect the normal growth and development of the crop over the aforementioned areas.

2. WEATHER OUTLOOK FOR THE SECOND DEKAD OF DECEMBER 2007

In the coming dekad the Bega's dry, windy and sunny weather condition mostly will dominate much of the country. In line with this, the highland sectors of northeast, central, east and southeast Ethiopia will experience cold weather conditions during night and early mornings. In contrast, isolated patches of clouds are likely to develop over the southern margins and southwest sectors, which induce light rain showers at few places. Generally, most parts of the country will experience dry weather condition; with below normal rains will be prevailing elsewhere.

3. AGROMETEOROLOGICAL CONDITIONS AND IMPACT ON AGRICULTURE

3.1 VEGETATION CONDITION AND IMPACT ON AGRICULTURE

Dry weather condition dominated most of Meher growing areas except few pocket areas of western Oromia. The wet condition over pocket areas of western Oromia & SNNPR might have favored crops at developing stages, perennial crops and availability of pasture and drinking water. On the other hand, the dry condition minimized the expected damage on fully matured crops and harvest and post harvest losses as result of moisture; moreover, the situation favored Meher harvest and post harvest activities in the country. However, the prevailed dry condition might have a negative impact on crops that have not attained full maturity. The observed midnight and morning cold weather condition might have caused crop damage on cereals and pulses that have not yet attained full maturity over the highlands of southern & central Amhara, central and eastern Oromia frost prone areas. Pursuant to crop phenological report, please refer table1 in the next page.

3.2 EXPECTED WEATHER IMPACT ON AGRICULTURE DURING THE COMING DEKAD

Cool and dry weather from northern hemisphere will enhance the lowering of midnight and morning temperatures as result expected crop damage on cereals and pulses that have not yet attained full maturity over frost prone areas of the highlands of southern & central Amhara, central and eastern Oromia. However, the dry condition will have a positive impact in minimizing the expected damage on fully matured crops, harvest and post harvest losses. Moreover, the situation will favor Meher harvest and post harvest activities in the country.

On the other hand, the expected occasional little rains over few places of southern and southwestern Ethiopia will favor crops at developing stages, perennial crops and availability of pasture and drinking water.

Table 1. Crop Phenological Report for the second dekad of December 2007

Station name	Region	Zone	Woreda	Major Crops			Phases		
				1	2	3	1	2	3
