

## HIGHLIGHTS

- Moderate to heavy rains experienced during the period...
- Dry reduces the expected maize yield...
- Rains expected over the north during 1-10 March 2005...

### 1.1 RAINFALL

Malawi continued to be under the influence of High Pressure Cell that prolonged dry conditions which started end of January 2005 over many parts of the country until the last three days of February when Congo Air brought rainfall to most parts of country breaking the widespread prolonged dry spell. This resulted in a number of places recording total rainfall amounts of more than 50 mm . Most areas started receiving the rains from $26^{\text {th }}$ February bringing respite from the unusual hot and dry conditions.
Areas that recorded significant rainfall totals above 150 mm during the last 8 -days of February include Ntaja Met (199.9mm and Lujeri (157mm), Dedza RTC ( 155.3 mm ), Salima Met ( 163.3 mm ) and Lifuwu (165.2mm). Significant rainfall totals as percentage of normal were as follows: Dedza RTC (367\%), Ntaja Met (358\%), Monkey Bay (289\%), Mzuzu (271\%), Mlangeni Njolomole (265\%), NRC (224\%), Salima and Mzimba (204\%) and Chitipa (203\%). See Map 1 and Table 1.
Total seasonal rainfall from $1^{\text {st }}$ October 2004 up to 28 February 2005 showed that most areas in Malawi have received normal rainfall despite the prolonged dry spell that has been experienced. This is due to the abundant rains that were received in November, December and early January. However, pockets of below normal rainfall exist in lower Shire Valley in the south while above normal rainfall situation exist at Mzimba, Karonga and Chitpa in the north. Areas that have received much below normal cumulative rainfall include Nkhata bay (58\%) in the north and Chikwawa (64\%) in Shire Valley. Map 2 and Table 1. [Note: Normal $=75-125 \%$, above normal $=$ ? 125\%, below normal $=$ ? $75 \%$, extremely below normal $=$ ? $50 \%$ ]

## MEAN AIR TEMPERATURE

Mean maximum temperatures demonstrate that hot weather continued over most pasts of Malawi during the last 8 -days of February 2005. Daily average maximum temperatures were in lower 30s over lakeshore and in Shire Valley and upper 20s elsewhere. The highest absolute maximum air temperature was recorded at Salima $\left(36.0^{\circ} \mathrm{C}\right)$ while the lowest absolute minimum temperature was reported at Bvumbwe, $15.6^{\circ} \mathrm{C}$.

Mean daily wind speeds at a height of 2 meters above ground continued to be light and variable. The values ranged from $0.7 \mathrm{~m} / \mathrm{s}(1.8 \mathrm{~km} / \mathrm{hr})$ at Chichiri in Blantyre to $1.4 \mathrm{~m} / \mathrm{s}(14.0 \mathrm{~km} / \mathrm{hr})$ at Chitipa, Mzuzu and Salima. See Table 2 for more details.

## MEAN RELATIVE HUMIDITY

The last 8-days of February 2005 became fairly moist particularly in the last three days when wet weather returned to most areas of Malawi. Mean daily relative humidity values ranged from $65 \%$ at Chitipa to $82 \%$ at Nkhata Bay. The average value during the period 21 to 28 February was $74 \%$.

## . AGROMETEOROLOGICAL ASSESSMENT

The rains received in the last 8days of February will not improve the current crop situation. Most crops have been scorched by the dry spell that occurred for more than one month in most parts of the country particularly over the south and some parts of the centre. The situation is worse along Shire river valley from Mangochi through Balaka to Chikwawa and Nsanje districts where due high temperatures and long sunshine hours some crops reached permanent wilting point and will not recover with these rains. Crops that have suffered most include maize, tobacco, beans and groundnuts. The dry spell has affected this year's maize yield, initially estimated at 1.7 million tonnes. The dry spell came at a time when most of the maize was at the critical stage of tasselling and cobbing which requires a lot of moisture. Due to prolonged dry spell some farmers might not harvest anything and this will have implications in food security during the coming consumption period (April 2005 - March 2006).

| . FORECAST FOR $-\quad$ MARCH |
| :---: |

Meanwhile weather systems indicate that pulses of Congo Air will maintain light to moderate rainfall over the north and some parts of centre while dry weather is expected over most parts of the south during the first 10-days of March 2005.

Glossary of some terms on this table

- $\mathrm{RH}=$ Relative Humidity
- Mean Temperature of the day =(Max of the day + Min of the same day )/2
- $\quad$ ABS $\operatorname{Max}(\mathrm{Min})=$ Absolute Maximum (minimum) is the highest (lowest) of maximum (minimum) temperatures observed $f$ or a given number of days (calendar month) of a specified period of months (years).
- To convert Meters Per Second (mps) to Kilometers per hour (Km/hr) = mpsx3.6
